## Introducing the power of Aquajet ERGO.

**Aquajet Systems AB proudly presents a groundbreaking new system for safe, effortless, and versatile industrial cleaning and hydrodemolition work. Aquajet Ergo might be the greatest thing since the invention of, well, hydrodemolition. From now on, the use of risky hand lances belongs in the history books. Behold the dawn of a new age.**

### Industrial cleaning's new best friend

Hydrodemolition is the safest and most effective method for protecting and preserving concrete structures. Now, it's also ideal for small-scale operations and every type of industrial cleaning job. Operations that require hand lance equipment are difficult, messy, and can be extremely dangerous. Hand lancing operations are also time consuming and often require large amounts of labor. The solution is **Aquajet Ergo**, a completely new system from the hydrodemolition innovators at Aquajet Systems. **Aquajet Ergo** replaces all forms of hand lance work on floors, walls or ceilings. Furthermore, it's perfect for hydrodemolition operations in confined areas and wherever a robot or other kinds of larger fixed hydrodemolition equipment won't fit. The system is designed to be a true problem solver and business enabler, and to make the operator's job and working conditions safer than ever before. **Aquajet Ergo** means putting operator safety and business first.

*"The power of change that **Aquajet Ergo** unleashes is truly extraordinary. It's a game changer for an entire industry. The industrial cleaning sector is and has always been important to Aquajet Systems, but now it's finally the center of our attention. **Aquajet Ergo** is basically everything that dangerous hand lancing isn't. By introducing **Aquajet Ergo** to the world, we do believe that our customers can get the job done safely and effortlessly," says Roger Simonsson, CEO of Aquajet Systems.*

### Easy to handle, safe to use

At the heart of **Aquajet Ergo** is the advanced control unit, the **Ergo Controller**. It works together with its arms and legs. Either a spring loaded high friction roller system called **Ergo Climber**, or a flexible rail system called **Ergo Spine**. All this together with the all new Ergo Power Head, with Aquajet's unique 45 degree lance angle and adjustable oscillation.

*"The very flexible **Ergo Spine** is easily configured to solve virtually any problem by just adding brackets and supports" – Ronnie Hilmersson, Chief Engineer of Aquajet Systems.*

PRESS RELEASE

Holsbybrunn, Sweden

April 2018

Every component in the **Aquajet Ergo system** can be handled, carried and transported by one person, and everything fits in one small van or on a standard pallet, thanks to smart design and low-weight materials. The dry weight of the control unit, **Ergo Controller**, is only 98 kilograms, and none of the additional parts weigh more than 25 kilograms. **Aquajet Ergo** can be delivered as a complete starter kit. Key system parts such as **Ergo Controller**, **Ergo Climber** and **Ergo Spine** are also sold separately.
